

## Descriere generala

Pompele cu roti dintate sunt proiectate pentru transformare energiei mecanice in energia fluidului de lucru (presiune si debit). Constructia simpla si preturile relativ mici, face ca pompele cu roti dintate sa aiba o gama foarte larga de utilizare in sistemel hidraulice.

## Design de baza

Pompa este compusa in general, dintr-o pereche de roti dintate sustinute de rulment, inserata intr-un corp. Este inchisa de doua capace (fata si spate). Arborele de antrenare este izolat radial. O eficienta volumetrica mare este asigurata prin jocul unui lagar monobloc cu bucsa.

## Moduri de antrenare

Pompa poate fi actionata direct sau indirect de catre (roti dintate, lanturi sau transmisii cu curea). Ambele tipuri de transmisii nu trebuie sa actioneze forte axiale sau radiale asupra axului pompei.

## Calcule de proiectare

Debit:

$$Q = \frac{q \cdot n \cdot \eta_q}{1000}$$

Momentul teoretic de antrenare :

$$M = \frac{q \cdot p}{20 \cdot \pi}$$

Puterea teoretica de antrenare:

$$P_t = \frac{Q \cdot p}{600}$$

Putere antrenare:

$$P = \frac{P_t}{\eta}$$

Q [l/min]

M [Nm]

P [kW]

q [cm<sup>3</sup>]

p [bar]

n [min<sup>-1</sup>]

η [%]

## General Description

The gear pumps are designed for transforming the mechanical energy as energy of the working liquid (pressure and flow rate). The simplified construction at relatively low cost allow their use in a wide range of hydraulic systems.

## Basic design

The pump consists essentially of a pair of gears supported in bush bearing, inserted in one body. It is closed between two covers (front and rear). The drive shaft is radially sealed. A high volumetric efficiency is ensured by especially designed bush bearing clearance.

## Drive arrangements

The pump can be driven directly or indirectly (by gears, chains or belt transmissions). Both drives must not impose axial or radial forces on the pump shaft.

## Design Calculations

Flow:

$$Q = \frac{q \cdot n \cdot \eta_q}{1000}$$

Theoretical drive torque:

$$M = \frac{q \cdot p}{20 \cdot \pi}$$

Theoretical drive power:

$$P_t = \frac{Q \cdot p}{600}$$

Drive power:

$$P = \frac{P_t}{\eta}$$

Q [l/min]

M [Nm]

P [kW]

q [cm<sup>3</sup>]

### Descriere si utilizare

Pompele noastre sunt clasificate in patru grupuri dimensionale. Acestea sunt simple, duble sau pompe ireversibile multiple, cu volum geometric constant. Putem oferi si pompe bidirectionale de asemenea.. Viteza maxima a fluidului la admisie trebuie sa fie de maxim 2,5 m/s si in cazul in care toate pompele pot lucra continuu, cu o presiune la admisie intre -0,2 si 0,5 bari si avand o presiune de refulare in concordanta cu specificatiile mentionate in catalog. La cerere, pompele poti fi echipate cu regulatoare de presiune sau de debit.

Pompele noastre sunt folosite in instalatii hidraulice sau centraline, pentru circuite hidrostatice ale utilajelor agricole, ale masinilor grele, masinilor unelte si altele.

### Montarea pompei

Există o gama largă de variante de construcție, în funcție de tipul cuplajelor, flanselor de prindere, flanselor de admisie și refulare, tinând cont de clasificarea din catalog.

Sistemul de cuplare, nu trebuie să dezvolte forte axiale sau radiale pe marginea axului și trebuie să transmită momentul de antrenare. Sensul de rotație al pompei trebuie să fie în concordanță cu sensul de rotație al motorului. Dupa ce pompa a fost instalată trebuie să se verifice dacă este cu rotire liberă.

### Fluidul de lucru

A se folosi numai ulei mineral, care poate menține caracteristicile de vascozitate. În timpul funcționării, vascozitatea este mai mare de  $15 \text{ mm}^2/\text{s}$ . Vascozitatea optimă este între  $25$  și  $100 \text{ mm}^2/\text{s}$ . trebuie să fie sub  $250 \text{ mm}^2/\text{s}$ . Pentru o perioadă limitată, la start rece, poate fi admisă o vascozitate de  $2000 \text{ mm}^2/\text{s}$ .

### Filtrare

Filtrarea uleiului hidraulic este de  $20 \mu\text{m}$  cu o concentrație de sub  $0,05\%$ . Nu sunt admise particule abrazive.

### Temperatura de operare

Pompele sunt proiectate să funcționeze continuu la temperaturi între  $-10$  și  $80^\circ\text{C}$ .

### Rotatie (Vedere pe ax)

- A Stanga**
- C Dreapta**
- B Bidirectional**

### Description and use

Our VP gear pumps are classified in four dimensional groups. These are simple, double or multiple irreversible pumps, with constant geometrical volume. We can offer you bidirectional pumps, too. The maximum velocity of the fluid to inlet ports has to be 2.5 m/s and in this case all the pumps can work continuously with an inlet pressure between -0.2 and 0.5 bar and the outlet pressure conforming to the catalogue.

Our demand, the pumps can be equipped with pressure or priority flow regulators.

Are used in hydraulic installation or power packs and for the hydrostatic circuits of agricultural machines, heavy-duty machines, machines-tool, others.

### Pump mounting

There are a lot of constructive variants depending on the type of couplings, fixing flanges, inlet and outlet flanges, according to the codification at the catalogue.

The coupling system must not impose axial or radial forces on the edge of the shaft and must transmit the driving moment. The pump revolution sense must be in concordance with the motor rotation. After the pump has been installed to the application before starting the motor it has to be verified that it is free turning.

### Working fluid

Only mineral-based oil may be used, that could keep the viscosity characteristics. During working time, the viscosity has to be more than  $15 \text{ mm}^2/\text{s}$ . The optimum working viscosity is between  $25$  and  $100 \text{ mm}^2/\text{s}$ . It should be less than  $250 \text{ mm}^2/\text{s}$ . For a limited time at cold start could be admitted a  $2000 \text{ mm}^2/\text{s}$  viscosity.

### Filtration

The filtration fineness of the hydraulic oil is  $20 \mu\text{m}$  with an impurity concentration under  $0,05\%$ . There are not admitted abrasive particles.

### Operating temperature

The pumps are destined for a continuously working conditions between  $-10$  and  $80^\circ\text{C}$ .

## Pope cu roti dintate

### Prezentare generală

#### VP1, VP11

Capacitate= 0.85 - 7.8 ccm/rot

Presiune Nom. = 100-250 bar

Presiune Max. = 110-270 bar

Viteza min/max = 800/5000 rot/min

## Gear Pumps

### General Presentation

VP

Displacement = 0.85 - 7.8 ccm/rev

Nom. Pressure = 100-250 bar

Max. Pressure = 110-270 bar

Speed min/max = 800/5000 rev/min

#### VP2 (VPDP, VPTP, VPQP)

Capacitate= 4 - 27.9 ccm/rot

Presiune Nom.= 150-250 bar

Presiune Max. = 160-270 bar

Viteza min/max = 800/3500 rot/min

#### VP3 (VPDP, VPTP, VPQP)

Capacitate= 19.5 - 63 ccm/rot

Presiune Nom.= 140-180 bar

Presiune Max.= 160-200 bar

Viteza min/max = 500/3000 rev/min

#### VP3 (VPDP, VPTP, VPQP)

Capacitate= 63 - 250 ccm/rev

Presiune Nominala= 100-180 bar

Presiuen Maxima= 110-200 bar

Viteza min/max = 500/2500 rev/min

Displacement = 19.5 - 63 ccm/rev

Nom. Pressure = 140-180 bar

Max. Pressure = 160-200 bar

Speed min/max = 500/3000 rev/min

Va rugam sa luat in considerare:  
Valorile presiunilor maxime si  
nominale depinde de capacitate

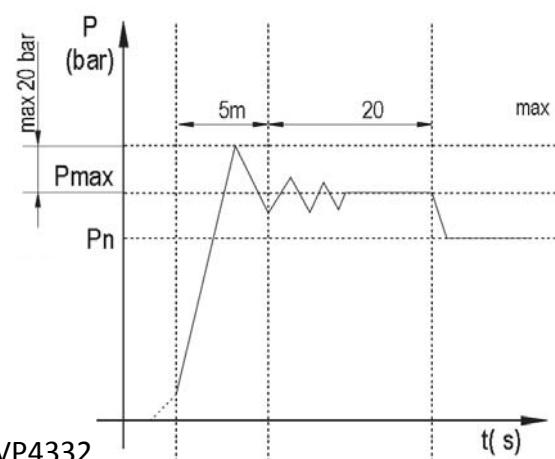

Please notice:

The values of nom. pressure and  
max. pressure are depends on the  
displacement

VPDP = Pompa dubla (double Pump), e.g. VP22; VP32

VPTP = pompa tripla (triple Pump), e.g. VP322; VP321

VPQP = Pompla cvatripla (quadro Pump), e.g. VP4321; VP4332

- Port de admisie tip 2 nu este disponibil pentru pompele cu port e admisie comun.
- Portul de admisie comun trebuie sa fie suficient de mare pentru ambele trepte.
- Este recomandat ca portul de admisie comun sa fie pe treapta cu capacitate mai mare.

- Inlet port type 2 is not available for pumps with common inlet port.
- The common inlet port should be large enough for both stages.
- It is recommended that the common inlet port is on the stage with the larger displacement

-----	---------------------------------	-----------------------------------	-------------------------------------	----------------------------	------------------------------	----------------------

• Pompele bidirectionale pot lucra fie in sensul acelor de ceasornic sau invers. Constructia pompelor este sunilara cu a pompelor normale, dar au doua admisii alternative si o scurgere externa. Din cauza garniturilor similare din interior, presiunea este limitata la 210 bari.

• The bidirectional pumps can work either clockwise or anticlockwise. The construction of the pumps is similar with normal pumps, but they have 2 alternative inlets and an external drain. Because symmetrical internal sealings, nominal pressure is limited at 210 bar.

G	Deutz cu prelucrare	-	-	-	-	-	-	-	65

La alegerea tipului de arbore, este necesar sa se stie momentul maxim al pompei. In special pentru pompele in mai multe trepte, este important sa se stie ca momentul intre treapta I si a II-a poate fi maxim 65 Nm.

*For choosing a shaft type, it is necessary to know the maximum torque of the pump. Especially for multistage pumps, it is important to know that the torque between the first and the second stage can be maximal 65 Nm.*

------	-----------	---	---	---	---	---	---	---

- Port de admisie tip 2 nu este disponibil pentru pompele cu port e admisie comun.
- Portul de admisie comun trebuie să fie suficient de mare pentru ambele trepte.
- Este recomandat ca portul de admisie comun să fie pe treapta cu capacitate mai mare.

- Inlet port type 2 is not available for pumps with common inlet port.
- The common inlet port should be large enough for both stages.
- It is recommended that the common inlet port is on the stage with the larger displacement

## Cod comanda pompe bidirectionale/Order code bidirectional pumps

HM1	Cm <sup>3</sup> /rot Ccm/rev	Arbore antrenare Driving Shaft	Flansa prindere Fatsening Flange	Port Admisie Inlet Port	Port Refulare Outlet Port	Sens rot Rotation
-----	---------------------------------	-----------------------------------	-------------------------------------	----------------------------	------------------------------	----------------------

• Pompele bidirectionale pot lucra fie in sensul acelor de ceasornic sau invers. Constructia pompelor este similara cu a pompelor normale, dar au doua admisii alternative si o scurgere externa. Din cauza garniturilor similare din interior, presiunea este limitata la 210 bari.

• The bidirectional pumps can work either clockwise or anticlockwise. The construction of the pumps is similar with normal pumps, but they have 2 alternative inlets and an external drain. Because symmetrical internal sealings, nominal pressure is limited at 210 bar.

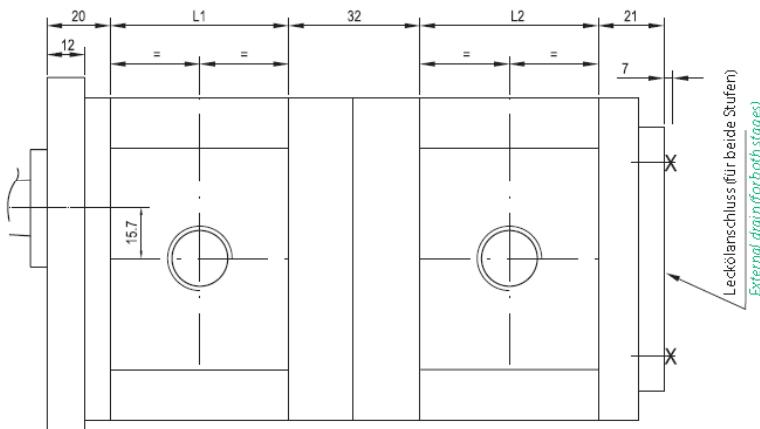

### Exemplu /Example

HM2	11,3	3	3	3	3	B
-----	------	---	---	---	---	---

## Cod comanda pompe bidirectionale reversible /Order code bidirectional reversible pumps

### Exemplu /Example

HM22	(16+6,3)	3	3	1	1	2	2	B
------	----------	---	---	---	---	---	---	---

Din cauza drenajului exterior comun  
pompele nu au garnituri intre trepte.  
Este posibil sa se produca la comanda pompe  
cu drenaj pe fiecare pompa si cu garnitura  
intermediara.

Because of the common external drain,  
the pumps have no sealing between  
stages.

It is possible to produce pumps with drain  
on every stage and intermediate sealing  
on request.

25,0	79,2		150	170	96							
27,9	84,0		140	160	97							

Va rugam sa luati in considerare:

- Pn: presiunea nominala
- Pmax: presiunea maxima la care pompele pot functiona intermitent (20 secunde); presiunea medie trebuie sa fie mai mica decat Pn..
- Varfurile de presiune in comutatie pot fi cu 20 de bari mai mari decat Pmax.
- Eficiența volumetrică  $\eta_{VN}$  este garantată la condiții nominale și o viscozitate de 30 ... 40 mm<sup>2</sup>/s.
- Datele mentionate mai sus sunt valabile și pentru pompe duble (pentru fiecare treapta separat)
- Funcționarea la viteza crescută, fără cavitare este posibilă numai cu o dimensiune corectă a portului de admisie.
- Presiunea absolută de admisie nu ar trebui să fie mai scăzuta de 0,7 bari.
- Pentru viteze mai mari de 1500 rev/min. Presiunea maxima trebuie să fie mai scăzuta decat rezultatul urmatoarei formule :

()

La cerere puteti comanda:

- PRD dubla HM21 cu HM1 ( $q = 0.85 \dots 7.8 \text{ ccm/rot}$ )
- Pompe cu accesorii :

  1. Supapa cu drenaj exterior.
  2. Supapa cu drenaj intern
  3. Supapa de debit cu retur extern

Please notice:

- Pn: nominal pressure
- Pmax: maximum pressure at which the pumps can work intermittently (max. 20 s); average pressure should be lower than Pn.
- Pressure peaks in commutation can be 20 bar higher than Pmax.
- Volumetric efficiency  $\eta_{VN}$  is guaranteed in nominal conditions and viscosity of 30 ... 40 mm<sup>2</sup>/s.
- The data's mentioned above are valid for double pumps as well (for every stage separately).
- Functioning at high speed, without cavitation is only possible with a sufficient inlet port size.
- The inlet pressure should not decrease under 0.7 bar absolute.
- For elevation speeds more than 1500 rev/min. max. pressure has to be lower than the result of the following formula:

On request you can order:

- Double gear pumps HM21 with HM1 ( $q = 0.85 \dots 7.8 \text{ ccm/rev}$ ).
- Pumps with accessories:
  1. valve with external drain
  2. valve with internal drain
  3. flow control valve with external return

## Pompa cu Roti Dintate VP3

- Pressure peaks in commutation can be 20 bar higher than Pmax.
- Volumetric efficiency  $\eta_{VN}$  is guaranteed in nominal conditions and viscosity of 30 ... 40 mm<sup>2</sup>/s.
- The data's mentioned above are valid for double pumps ass well (for every stage separately).
- Functioning at high speed, without cavitation is only possible with a sufficient inlet potsize.
- The inlet pressure should not decrease under 0.7 bar absolute.
- For elevation speeds more than 1500 rev/min. max. pressure has to be lower than the result of the following formula:

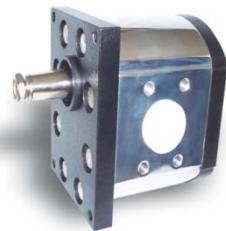

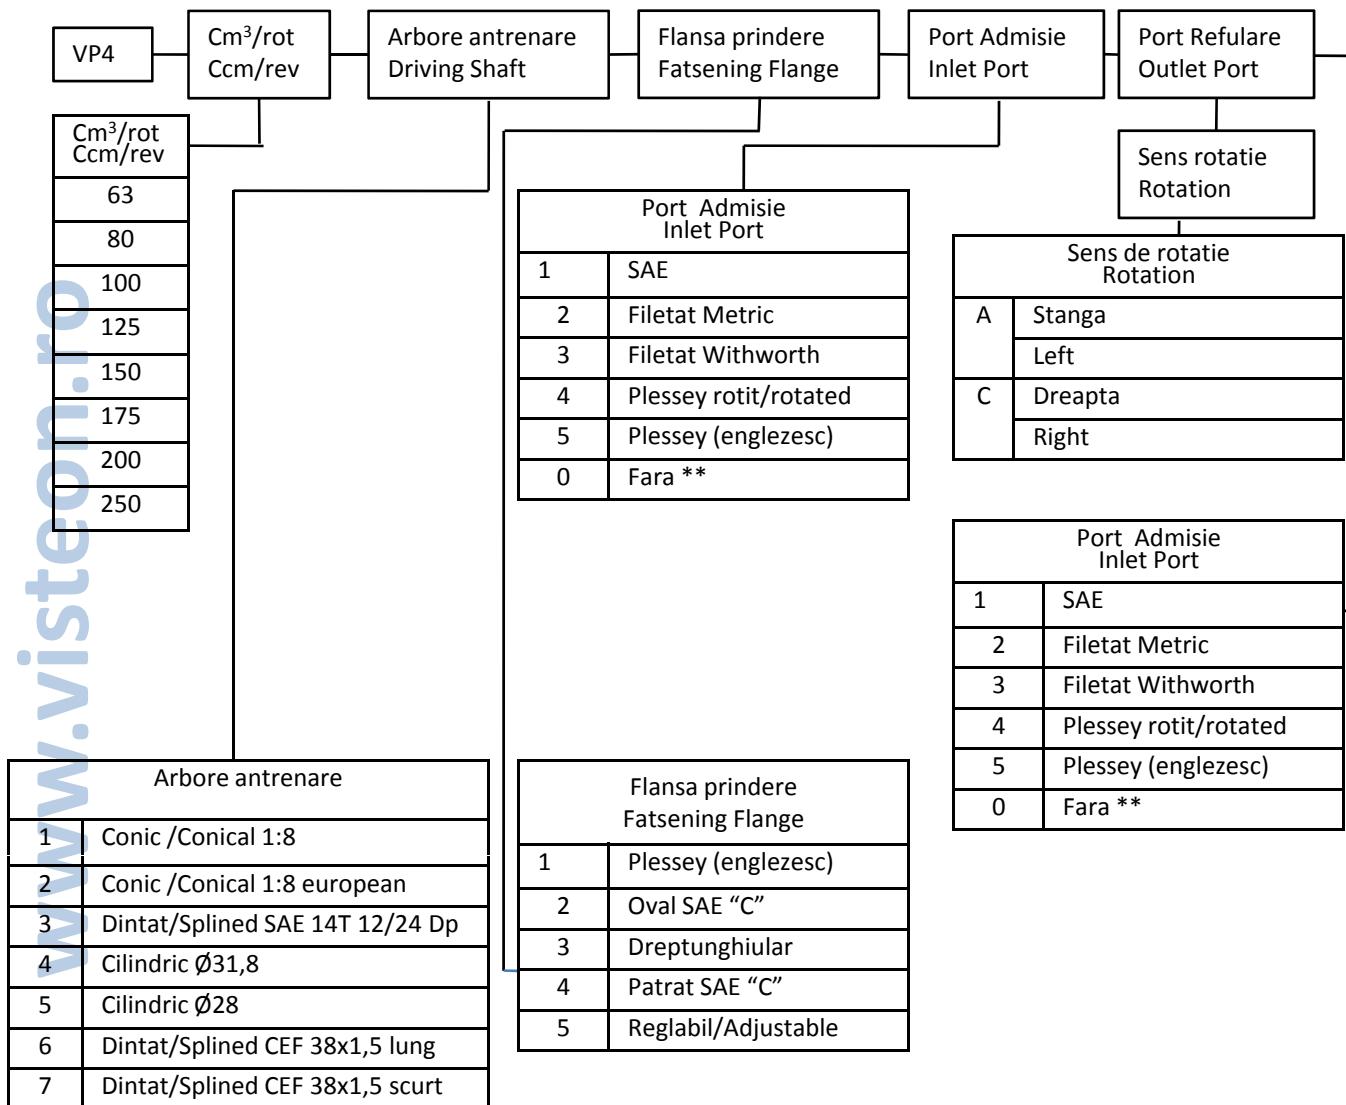

$$p \leq \frac{13400000}{\text{cm}^3/\text{U} \cdot \eta_{\text{ref}}}$$

## Pompa cu Roti Dintate VP4

**Pompa dubla cu roti dintate VP44**

**Gear pump VP4, Double gear pump VP4**

Cod pentru comanda VP4/Order Code VP44

**VP**

*Tipul de flansa 4 este disponibila numai pentru pompa HMR 4*

*Flange type 4 is only available for pump type HMR4*

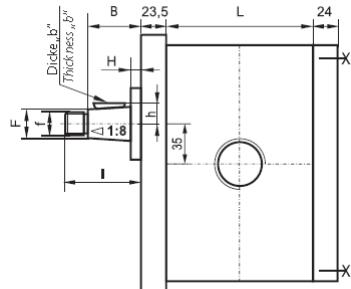

*\*\* Daca porturile de admisie sau refulare nu sunt pe corpul pompei.*

*\*\* If the inlet or outlet ports are not on the body of the pump.*

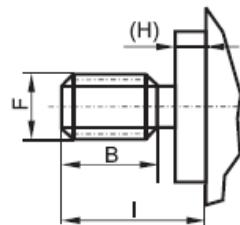

Exemplu: HM4 150 2 1 4 4 A

## Arbore antrenare/ Driving Shaft

La cerere se poate fabrica:

--Prd dubla HM43, HM41, sau HMR43, HMR42, HMR41 (cu capacitate mica in a II-a treapta)

--Pompe cu alte capacitatii

On request can be manufactured:

--Double gear pumps HM43, HM42, HM41 or HMR43, HMR42, HMR41 (with lower displacement in second stage)

--Pumps with other displacements

## Date Tehnice/Technical Data

125	124,5				94		500	1500			
150	133,0				95						
175	141,5				96						
200	150,0				97						
250	167,0				98						

Va rugam sa luati in considerare:

--Pn: presiunea nominala

--Pmax: presiunea maxima la care pompele pot functiona intermitent (20 secunde); presiunea medie trebuie sa fie mai mica decat Pn..

--Varfurile de presiune in comutatie pot fi cu 20 de bari mai mari decat Pmax.

--Eficiența volumetrică  $\eta_{VN}$  este garantată la condiții nominale și o viscozitate de 30 ... 40 mm<sup>2</sup>/s.

--Datele mentionate mai sus sunt valabile și pentru pompe duble (pentru fiecare treapta separat)

--Functionarea la viteza crescută, fără cavitare este posibilă numai cu o dimensionare corectă a portului de admisie.

--Presiunea absolută de admisie nu ar trebui să fie mai scăzuta de 0,7 bari.

--Pentru viteze mai mari de 1500 rev/min. Presiunea maxima trebuie să fie mai scăzută decât rezultatul următoarei formule :

$$p \leq \frac{40500000}{\text{cm}^3/\text{U} \cdot \eta_{ef}}$$

Please notice:

--Pn: nominal pressure

--Pmax: maximum pressure at which the pumps can work intermittently (max. 20 s); average pressure should be lower than Pn.

--Pressure peaks in commutation can be 20 bar higher than Pmax.

--Volumetric efficiency  $\eta_{VN}$  is guaranteed in nominal conditions and viscosity of 30 ... 40 mm<sup>2</sup>/s.

--The data's mentioned above are valid for double pumps ass well (for every stage separately).

--Functioning at high speed, without cavitation is only possible with a sufficient inlet potsize.

--The inlet pressure should not decrease under 0.7 bar absolute.

--For elevation speeds more than 1500 rev/min. max. pressure has to be lower than the result of the following formula:

$$p \leq \frac{40500000}{\text{cm}^3/\text{U} \cdot \eta_{ef}}$$
